EINFACH SIMPEL

Granuläres .NET-Web-Development mit Nancy- und Simple.Data- Frameworks

Timothée Bourguignon

Mathema Software GmbH

Why?

- Simplicity & Readability
- Modularity
- OpenSource

- "Close" to HTTP
- Very explicit routing
- Runs anywhere

- „Super Duper Happy Path“

3.– 6. September 2012

First date with Nancy

„Lightweight Web Framework for .NET“

nancyfx.org | [#nancyfx](https://twitter.com/nancyfx)

Microframework

- Serve up web content
- Lean
- Extensible API
- Simple setup
- “Close to the metal”

„Hello Sinatra“

```
$ gem install sinatra  
$ ruby -rubygems app.rb
```

```
require 'sinatra'  
get '/hi' do  
  "Hello World!"  
end
```

„Hello Nancy“

```
namespace NancyDemo
{
    public class MainModule : NancyModule
    {
        public MainModule()
        {
            Get[ "/hi" ] = _ => "Hello Nancy!";
        }
    }
}
```

NANCY

Setting up a Nancy project

- Create an empty web project
- Install Nancy via Nuget:

```
PM> Install-package Nancy.Hosting.Aspnet  
Or      Install-Package Nancy.Hosting.Owin  
Or      Install-Package Nancy.Hosting.Wcf
```

...

- Adds Nancy assembly references
 - Sets up web.config (if using IIS)
-
- Create a module and define a route

NANCY

Architectural Overview

- HTTP handler
- Modules
- Routes
- Response
- Views
- View engines
- Bootstrapping (IoC)
- Hosting
 - ASP.NET
 - WCF
 - Azure
 - Umbraco
 - Owin (~ Ruby's "Rack")
 - Self-hosted
- Authentication
- ...

NANCY

Module's Anatomy

```
public class MyModule: NancyModule
{
    Public MyModule()
    {
        Get["/"] = _ => { ... };
        Get["/submit"] = _ => { ... };
        Post["/submit"] = _ => { ... };
        Get["/voteup/{id}"] = parameters => { ... };
        Get["/login"] = _ => { ... };
        Get["/logout"] = _ => { ... };
        Post["/login"] = _ => { ... };
    }
}
```

NANCY

Route

- Composed of
 - **Method** (HTTP Methods: Get, Post, Put, Delete...)
 - **Pattern**
 - **Action** (+parameters & result object)
 - Condition (optional)

```
Get[ "/voteup/{id}" ] = x => {  
  return View[ "Voteup", x.id ];  
};
```

NANCY

Route pattern

- Literal segments: `"/voteup"`
- Variable segments: `"/voteup/{id}"`
- Literal segments + regular expression back-references: `"/voteup/(?<id>[\d]+)"`

```
Get["/voteup/{id}"] = x => {  
  return View["Voteup", x.id];  
};
```

NANCY

Route resolver

- Request method & Path matching
- Picks the first route among those which captures the least parameters

Lifecycle

- "Before" pipeline is executed (if present)
- Route's action is invoked
- "After" pipeline is executed (if present)

```
Get[ "/voteup/{id}" ] = x => {  
  return View[ "Voteup", x.id ];  
};
```

NANCY

Route action, parameters & Response

- Receives a .Net4.0 “*dynamic*” object packaging the request parameters

`x => x.id`

- Returns an “*Nancy.Response*” object

```
Get[ "/voteup/{id}" ] = x => {  
    return View[ "Voteup", x.id ];  
};
```

NANCY

Nancy.Response

- *Nancy.Response* implicit casts
 - Int32 → HTTP Status Code (ex: 404, No Found)
 - 'HttpStatusCode' enumerable value
 - String → body of the response
 - 'Action<Stream>'
- Response formatters:
 - As File, Image, Json, Xml & Redirect
- Views

```
Get["/voteup/{id}"] = x => {  
    return View["Voteup", x.id];  
};
```

Serving up views

- Views are discovered in the project
- Supported View Engines
 - SuperSimpleViewEngine (basic HTML & iteration syntax)
 - Razor
 - Spark
 - Django
 - DotLiquid
 - Any other implementation IViewEngine
 - Selected dynamically, based on the view's file extension

NANCY

View model & Model Binding

- Data passed via Query string, captured parameters on routes or body of a request
- Module → View
 - Supports any object Type
 - Uses “dynamic” per default
- Module ← View
 - Model binding for all ways

```
Foo foo = this.Bind();  
var foo = this.Bind<Foo>();  
this.BindTo(foo);
```

NANCY

Model Validation

- Similar to MVC

```
using System.ComponentModel.DataAnnotations;
```

```
[Required]
```

```
public DateTime CreationDate { get; set; }
```

```
var result = this.Validate(model);
```

```
if (!result.IsValid)
```

```
{
```

```
    return View["CustomerError", result];
```

```
}
```

Simple.Data

A „/“, e.g. an O/RM without O, R or M

Simple.Data

- Inspired by Ruby's DataMapper & ActiveRecord
- Based on the .NET 4.0 “dynamic” keyword

- No SQL injection

- Easy
- Intuitive
- Flexible

- Database agnostic
- Convention over Configuration
- Not an O/RM

Hello Simple.Data

```
public void Greetings()  
{  
    var db = Simple.Data.Database.Open();  
  
    var hello = db.Hello.FindById(1);  
  
    Console.WriteLine("{0}, {1}!",  
        hello.Greeting, hello.Subject);  
}
```

Setting up a Simple.Data project

- Install the driver you need via Nuget

```
PM> Install-Package Simple.Data.MongoDB
```

- Create a “dynamic” Database object

NANCY

Simple CRUD operations

```
public void CRUD()
{
    db.People.FindAllByName("Bob");
    db.People.FindByFirstNameAndLastName("Bob", "X");
    db.Users.All().OrderByJoinDateDescending();
    db.Users.All().OrderByJoinDate().ThenByNickname();

    db.People.Insert(Id: 1, FirstName: "Bob");
    db.People.Insert(new Person(){ Id = 1, Name = "Bob" } );

    db.People.UpdateById(Id: 1, FirstName: "Robert");
    db.People.DeleteById(1);
}
```

Barely less simple operations

- Complex criteria

```
db.Customers.Find(db.Customers.MoneyOwing > 0);
```

- Paging

```
db.Users.All().OrderByNickname().Skip(10).Take(10);
```

- Having

```
db.Posts.All().Having(db.Posts.Comments.CommentId  
                        .Count() == 0);
```

- Upsert (Update or Insert)

```
db.Users.Upsert(user);
```

Complex operations

- Eager loading with the “with” operator

```
db.Customers.WithOrders().Get(1);
```

```
db.Customers.FindAllByCustomerId(1).WithOrders();
```

- Implicit / Explicit Join, OuterJoin...

Drivers & Supported DBs

- ADO-based access to relational databases:
 - SQL Server 2005 and later (including SQL Azure)
 - SQL Server Compact Edition 4.0
 - Oracle
 - MySQL 4.0 and later
 - SQLite
 - PostgreSQL
 - SQLAnywhere
 - Informix
- MongoDB
- OData

Second date with Nancy

In case the SuperDuperHappyPath is not completely Super, Duper or Happy yet...

Nancy's Bootstrapping (IoC)

uses IoC containers to bootstrap the framework

discovers and loads any implementation from
`INancyBootstrapper`

The `DefaultNancyBootstrapper` uses `TinyIOC`

Nancy also includes bootstrappers for

- Ninject

Authentication

- Nancy.Authentication.Basic
 - Basic HTTP authentication
- Nancy.Authentication.Forms
 - Proper authentication
 - Facebook, oAuth etc. on their way

Authentication

```
public class MyBootstrapper : DefaultNancyBootstrapper
{
    protected override void InitialiseInternal(TinyIoC.TinyIoCContainer
container)
    {
        base.InitialiseInternal(container);
        FormsAuthentication.Enable(this,
            new FormsAuthenticationConfiguration
            {
                RedirectUrl = "~/login",
                UsernameMapper = container.Resolve<IUsernameMapper>()
            });
    }
}

public class MyModule : NancyModule
{
    public MyModule() : base("/secure")
    {
        this.RequiresAuthentication();
        Get["/"] = _ => "Secure!";
    }
}
```

Testing

- Nuget: PM> Install-Package Nancy.Testing

- „Browser“ class

```
var result = browser.Get("/", with => {  
    with.HttpRequest(); });
```

- Assert

```
response.Body["#errorBox"]  
    .ShouldExistOnce()  
    .And.ShouldBeOfClass("floatingError")  
    .And.ShouldContain("invalid",  
        StringComparison.InvariantCultureIgnoreCase);
```

Nancy.Diagnostic

localhost/_nancy

- Information
- Interactive diagnostic
- Request Tracing
- Settings

The screenshot shows the Nancy diagnostic tool interface. At the top left is the Nancy logo (a stylized profile of a head) and the word "NANCY" in large white letters. Below this, the interface is divided into sections. The "Configuration" section is visible, listing various components and their default values. The "Version" section shows the current version is v0.11.0.0. The "Hosted" section shows the application is hosted on Aspnet (v0.11.0.0) using TinyIoC. The "Configuration" section lists various components such as Route Resolver, Route Pattern Matcher, Context Factory, Nancy Engine, Module Key Generator, Route Cache, Route Cache Provider, View Locator, View Factory, Nancy Module Builder, Response Formatter Factory, Model Binder Locator, Binder, Binding Defaults, Field Name Converter, Model Validator Locator, View Resolver, View Cache, Render Context Factory, View Location Cache, View Location Provider, Error Handlers, Csrf Token Validator, Object Serializer, and Serializers.

Section	Property	Value
Version	Version	v0.11.0.0
	Caches Disabled	true
	Traces Disabled	false
	Case Sensitivity	Insensitive
	Root Path	G:\WORKSPACE\NetHN\NetHN\
	Hosting	Aspnet (v0.11.0.0)
	Bootstrapper Container	TinyIoC
Configuration	Located Bootstrapper	NetHN.FormsAuthBootstrapper
	Loaded View Engines	SuperSimple
	Route Resolver	Razor
	Route Pattern Matcher	Nancy.Routing.DefaultRouteResolver
	Context Factory	Nancy.Routing.DefaultRoutePatternMatcher
	Nancy Engine	Nancy.DefaultNancyContextFactory
	Module Key Generator	Nancy.NancyEngine
	Route Cache	Nancy.Bootstrapper.DefaultModuleKeyGenerator
	Route Cache Provider	Nancy.Routing.RouteCache
	View Locator	Nancy.Routing.DefaultRouteCacheProvider
View Factory	Nancy.ViewEngines.DefaultViewLocator	
Nancy Module Builder	Nancy.ViewEngines.DefaultViewFactory	
Response Formatter Factory	Nancy.Routing.DefaultNancyModuleBuilder	
Model Binder Locator	Nancy.DefaultResponseFormatterFactory	
Binder	Nancy.ModelBinding.DefaultModelBinderLocator	
Binding Defaults	Nancy.ModelBinding.DefaultBinder	
Field Name Converter	Nancy.ModelBinding.BindingDefaults	
Model Validator Locator	Nancy.ModelBinding.DefaultFieldNameConverter	
View Resolver	Nancy.Validation.DefaultValidatorLocator	
View Cache	Nancy.ViewEngines.DefaultViewResolver	
Render Context Factory	Nancy.ViewEngines.DefaultViewCache	
View Location Cache	Nancy.ViewEngines.DefaultRenderContextFactory	
View Location Provider	Nancy.ViewEngines.DefaultViewLocationCache	
Error Handlers	Nancy.ViewEngines.FileSystemViewLocationProvider	
Csrf Token Validator	Nancy.ErrorHandling.DefaultErrorHandler	
Object Serializer	Nancy.Security.DefaultCsrfTokenValidator	
Serializers	Nancy.DefaultObjectSerializer	
	Nancy.Responses.DefaultJsonSerializer	

My opinion

- Pros

- It is incredibly simple, readable & flexible
- It runs everywhere (Self hosted on Mobile?)
- Great for Webservice or small / fast projects

- Cons

- Hard to picture a large project with Nancy or Simple.Data
- Flexibility via „*dynamic*“ can be double edged

- Nancy & Simple.Data cannot do more or less than the others
... but they do it in a very elegant and efficient manner
